

CHAPTER V

CONCLUSION

The Conclusion from The Result of The Influence of The Application of Oral Interview Test Towards The Students' Speaking Ability to The Second Year Students at SMP PGRI Patrol.

After calculating and interpreting the data available at the research which has been done by the writer, than he comes to the conclusion that can be used to answer three question that have been formulated in chapter I (one) in the question of doing research as follows:

1. From the result of the students' response on the application of oral interview test, it can be stated that the students have a good response on the application of oral interview test in measuring their speaking ability. It is because that the students who choose strongly agree are 17.27% and the students who choose agree are 61.97%, and those who choose disagree are 4.85%.
2. After calculating and interpreting the data, the writer concludes that there is positive correlation between x variable and y variable. Taking a point of view from the result of the value of "r" product moment (that is 0.420),

which the value of it is between 0.40 – 0.70. It means that the correlation between x variable and y variable is enough or sufficient positive correlation. It can be said that a high and low of the students' speaking ability has correlation or influenced by the application of oral interview test, because from the result of hypothesis calculation there is significant and positive correlation between x variable and y variable.

3. Based on the calculation, the writer finds that 17.64% is the big influential level from the correlation between the students' response on the application of oral interview test and the students' speaking ability by using oral interview test for the second year students at SMP PGRI Patrol. It can be known that 82.36% of other factors influencing the students' speaking ability.
